CASE STUDY 05 · FINAL YEAR PROJECT

Lawyer–Client Matching Platform

My final year project at COMSATS: a web platform that helps clients find the right lawyer by expertise and search criteria, built end to end from database to interface.

CONTEXT
Final Year Project, COMSATS Abbottabad

STACK
React · Node.js · Express · MongoDB

YEAR
2025–2026

STATUS
Complete

01 / the problem

The problem

Finding a lawyer usually depends on word of mouth. A client with a specific legal issue has no easy way to compare lawyers by what they actually practice. The platform brings both sides together and matches them on expertise and search parameters.

02 / what i built

What I built

Matching & search

Clients find lawyers by area of expertise and other search criteria.

REST API

Express endpoints for secure data exchange between the React front end and the database.

Data model

MongoDB schemas for clients, lawyers and their interactions.

Payments

API endpoints for payment processing.

03 / architecture

Architecture

I set up production-like environments: environment variables for secrets and configuration, CORS policies between front end and API, and server deployment configuration.

04 / what i learned

What I learned

- Designing a full MERN application from the schema up.
- Building and securing REST APIs.
- Configuration management across environments — an early taste of the DevOps side of software.
